

# Chi-Square Analysis

## Credit Ratings & Bond Default Outcomes in the Indian Corporate Bond Market

### Project Overview

This project applies the Chi-Square Test of Independence to the Indian corporate bond market to determine whether a bond's credit rating is statistically associated with its default outcome. Credit ratings assigned by agencies such as CRISIL and ICRA are intended to communicate default risk; this analysis tests that claim empirically using a contingency table framework.

| $H_0$ (Null Hypothesis)                                                                                                     | $H_1$ (Alternate Hypothesis)                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Credit rating and bond default outcome are <b>independent</b> — ratings carry no predictive information about default risk. | Credit rating and bond default outcome are <b>associated</b> — ratings meaningfully differentiate default risk. |

### Data & Methodology

|                    |                                                          |
|--------------------|----------------------------------------------------------|
| Dataset Size       | 240 bond observations                                    |
| Design             | Balanced — 60 bonds per credit rating category           |
| Rating Agency      | CRISIL / ICRA (Indian credit rating agencies)            |
| Table Structure    | 4 × 5 contingency table (4 ratings × 5 default outcomes) |
| Test               | Chi-Square Test of Independence                          |
| Significance Level | $\alpha = 0.05$                                          |

### Contingency Table — Observed Frequencies (O)

| Credit Rating | No Default | Technical Default | Restructured | Partial Default | Full Default | Total |
|---------------|------------|-------------------|--------------|-----------------|--------------|-------|
| AAA           | 56         | 2                 | 1            | 1               | 0            | 60    |
| AA            | 49         | 4                 | 3            | 2               | 2            | 60    |
| BBB           | 38         | 6                 | 7            | 5               | 4            | 60    |
| BB & Below    | 20         | 6                 | 9            | 8               | 17           | 60    |
| Total         | 163        | 18                | 20           | 16              | 23           | 240   |

Row totals are equal (60 each), reflecting a balanced sampling design across all credit rating categories.

### Expected Frequencies (E)

Under  $H_0$ , expected frequency for each cell = (Row Total × Column Total) / Grand Total. Since all row totals are equal (60) and the grand total is 240, each expected value =  $0.25 \times$  Column Total.

| Credit Rating | No Default | Technical Default | Restructured | Partial Default | Full Default | Total |
|---------------|------------|-------------------|--------------|-----------------|--------------|-------|
| AAA           | 40.75      | 4.5               | 5.0          | 4.0             | 5.75         | 60    |
| AA            | 40.75      | 4.5               | 5.0          | 4.0             | 5.75         | 60    |
| BBB           | 40.75      | 4.5               | 5.0          | 4.0             | 5.75         | 60    |
| BB & Below    | 40.75      | 4.5               | 5.0          | 4.0             | 5.75         | 60    |
| Total         | 163        | 18                | 20           | 16              | 23           | 240   |

### Chi-Square Computation — $(O - E)^2 / E$

| Rating     | Outcome         | O  | E     | O - E  | (O-E) <sup>2</sup> | (O-E) <sup>2</sup> /E |
|------------|-----------------|----|-------|--------|--------------------|-----------------------|
| AAA        | No Default      | 56 | 40.75 | 15.25  | 232.5625           | 5.7071                |
|            | Tech. Default   | 2  | 4.50  | -2.50  | 6.2500             | 1.3889                |
|            | Restructured    | 1  | 5.00  | -4.00  | 16.0000            | 3.2000                |
|            | Partial Default | 1  | 4.00  | -3.00  | 9.0000             | 2.2500                |
|            | Full Default    | 0  | 5.75  | -5.75  | 33.0625            | 5.7500                |
| AA         | No Default      | 49 | 40.75 | 8.25   | 68.0625            | 1.6702                |
|            | Tech. Default   | 4  | 4.50  | -0.50  | 0.2500             | 0.0556                |
|            | Restructured    | 3  | 5.00  | -2.00  | 4.0000             | 0.8000                |
|            | Partial Default | 2  | 4.00  | -2.00  | 4.0000             | 1.0000                |
|            | Full Default    | 2  | 5.75  | -3.75  | 14.0625            | 2.4457                |
| BBB        | No Default      | 38 | 40.75 | -2.75  | 7.5625             | 0.1856                |
|            | Tech. Default   | 6  | 4.50  | 1.50   | 2.2500             | 0.5000                |
|            | Restructured    | 7  | 5.00  | 2.00   | 4.0000             | 0.8000                |
|            | Partial Default | 5  | 4.00  | 1.00   | 1.0000             | 0.2500                |
|            | Full Default    | 4  | 5.75  | -1.75  | 3.0625             | 0.5326                |
| BB & Below | No Default      | 20 | 40.75 | -20.75 | 430.5625           | 10.5660               |
|            | Tech. Default   | 6  | 4.50  | 1.50   | 2.2500             | 0.5000                |
|            | Restructured    | 9  | 5.00  | 4.00   | 16.0000            | 3.2000                |
|            | Partial Default | 8  | 4.00  | 4.00   | 16.0000            | 4.0000                |
|            | Full Default    | 17 | 5.75  | 11.25  | 126.5625           | 22.0109               |
| TOTAL      |                 |    |       |        | 66.8124            |                       |

### Statistical Results

| Chi-Square Statistic | Degrees of Freedom | Critical Value ( $\alpha = 0.05$ ) | Decision     |
|----------------------|--------------------|------------------------------------|--------------|
| 66.8124              | 12                 | 21.03                              | Reject $H_0$ |

$df = (Rows - 1) \times (Columns - 1) = (4 - 1) \times (5 - 1) = 3 \times 4 = 12$  | Since  $66.81 > 21.03$ , we reject  $H_0$  at the 5% significance level.

Key Findings & Interpretation

|                                          |                                                                                                                                                                                                  |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AAA bonds — Strong outperformance:       | 56 of 60 bonds recorded no default, against an expected 40.75. Zero full defaults were observed versus the expected 5.75, confirming AAA as the most reliable low-risk category.                 |
| BB & Below bonds — Significant distress: | Only 20 bonds avoided default, far below the expected 40.75. Full defaults reached 17 — nearly 3× the expected 5.75. This is the single largest contributor to the chi-square statistic (22.01). |
| Investment-grade gradient (AA → BBB):    | Both categories show moderate deviations, with a clear escalation in default frequency as ratings decline, consistent with a risk-rating spectrum.                                               |
| Ratings carry informational value:       | The test statistically validates that CRISIL/ICRA credit ratings are meaningful predictors of default risk in the Indian corporate bond market.                                                  |

Conclusion: There is statistically significant evidence ( $\chi^2 = 66.81$ ,  $df = 12$ ,  $\alpha = 0.05$ ) that credit ratings and bond default outcomes are associated in the Indian corporate bond market. Null hypothesis rejected.

Statistical tool: Chi-Square Test of Independence | Dataset: 240 Indian corporate bonds (simulated for academic demonstration; directional patterns consistent with CRISIL/ICRA rating methodology) | Rating agencies: CRISIL / ICRA | Significance level:  $\alpha = 0.05$
